

SenIQ — Product Roadmap

Sentiment-driven market intelligence • Budget stance: cheapest-viable • Updated 2026-06-20

This roadmap supersedes the phase ordering in *PLAN.md*. The original plan built every feature on localhost and deferred hosting. Two launch blockers — **OAuth sign-in** and **Stripe/Razorpay billing** — both require a public domain over HTTPS (for OAuth callback URLs and payment webhooks). So **Cloud Deployment + Domain** is pulled to the front of the remaining work; OAuth and billing follow once the public surface exists.

Where we are today

Phases 0 through 3.5 are built and verified end-to-end on Postgres.

Phase	Scope	Status
0 · Foundations	Postgres + migration runner, config/feature-flag layer, global disclaimer	Done
1 · Multi-asset portfolio	Equity / crypto / commodity, per-holding quantity → exposure weights	Done
2 · Sentiment engine v2	Decay/momentum/90-day z-score, multi-source ingest, FinBERT, Portfolio Impact Scoring (North Star)	Done
3 · Smart money	13F via SEC EDGAR + Congress trades, follows, signed outbound webhooks	Done
3.5 · News relevance & de-spam	3-bucket feed (holdings/market/world), event clustering, materiality alerts, top-level tab UI	Done

The road ahead

Phase 4 — Cloud Deployment, Domain & HTTPS [NEW · do first · unblocks 5 & 6]

Goal: Take SenIQ off localhost onto a public, always-on, TLS-secured host so the cron pipeline runs 24/7 and OAuth/Stripe callbacks have a real URL.

- **Hosting:** deploy to a managed PaaS (recommend **Render** or **Fly.io** — cheapest-viable, auto-TLS, built-in cron/worker support). Web service for Express + the in-process node-cron pipeline.
- **Managed Postgres:** move off the local `seniq` DB to a managed instance (Render PG / Neon / Supabase). Keep the `DATABASE_URL` contract; migrations already run on boot.
- **Domain name:** register a domain (e.g. `seniq.app` / `getseniq.com` via Cloudflare or Namecheap) and point DNS at the host.
- **HTTPS/TLS:** automatic certs from the host (or Cloudflare proxy); force HTTPS + HSTS.
- **Secrets:** move `.env` into host environment variables (JWT secret, Finnhub, Reddit, SEC UA, congress URL, and later Stripe/OAuth keys). Rotate the JWT secret for production.
- **CI/CD:** auto-deploy on push to `main`; run migrations on deploy.
- **Ops baseline:** health-check endpoint, structured logs, error monitoring (free Sentry tier), and automated DB backups.

Kickoff Qs: Render vs Fly vs VPS? Which domain to register + registrar? Managed PG provider? Keep cron in-process or split a worker dyno?

Done when: the app is reachable at `https://<domain>` over TLS, migrations apply on deploy, and the news + smart-money cron jobs run in the cloud.

Phase 5 — Auth & Accounts — OAuth [NEW]

Goal: Add social sign-in beside the existing email/password so users onboard in one click; depends on the public HTTPS domain from Phase 4 for callback URLs.

- **OAuth providers:** Google first (highest conversion), GitHub optional. Use Authorization Code flow; callback at `https://<domain>/api/auth/oauth/<provider>/callback`.
- **Account model:** link an OAuth identity to a user row by verified email so password + Google land on the same account; store provider + provider_id.
- **Email flows:** email verification on signup + password reset (needs the email provider — see cross-cutting).
- **Hardening:** production JWT secret, sensible token expiry, optional refresh tokens, rate-limit auth endpoints.

Kickoff Qs: Which providers at launch (Google only, or + GitHub/Apple)? Require email verification before use? Refresh tokens now or later?

Done when: a user can sign in with Google and land directly in their portfolio, and email/password accounts can reset their password.

Phase 6 — Tiers & Billing (Free / Plus / Pro) [was Phase 4]

Goal: Monetize via feature gating + payments, with hard cost guardrails on the Claude-backed reports. Needs the public HTTPS domain (Phase 4) for payment webhooks.

- **Gating:** add subscription_tier to users + middleware; this finally enforces the smart-money split (Free teaser / Plus full / Pro webhooks) left open since Phase 3.
- **Payments:** Stripe (US) + Razorpay (India); webhook endpoints for tier changes. Region-gate by card BIN, not IP.
- **Pricing (decided):** Plus \$9/mo (■399), Pro \$24/mo (■999); annual ≈ 2 months free. Claude COGS is USD-fixed, so India can be cheaper but never below cost.
- **Claude cost guardrails (non-negotiable):** reports are server-scheduled only (no on-demand button); per-user daily quota; hard per-call token caps; global daily spend kill-switch; degrade to local Ollama past budget; log every call.

Kickoff Qs: Final prices + annual discount confirmed? Stripe + Razorpay accounts ready? Global daily kill-switch \$ ceiling?

Done when: gating returns an upsell for lower tiers, Stripe/Razorpay upgrades flip the tier via webhook, and the global kill-switch trips correctly in testing.

Phase 7 — Strategies Tab [was Phase 5]

Goal: Present 3–5 well-known sentiment strategies as education (not signals) with live applicability to the user's current holdings. No backtesting here (that lives in the separate project).

- Describe each approach + logic: sentiment-momentum, sentiment-reversal (fade extremes), news-volume spike, smart-money follow, macro-risk-off overlay.
- **Live applicability:** show which of the user's current holdings each strategy flags right now from today's sentiment / z-score / impact data.
- Educational disclaimers throughout; link out to the user's backtesting project for historical performance.

Done when: each strategy shows a description, its logic, and a live 'what it flags in your portfolio today' view.

Phase 8 — API / MCP Server [was Phase 6]

Goal: Expose the platform as a clean REST API and an MCP server the agent consumes, so the UI and the agent share one tool layer.

- REST API keyed by tier: portfolio sentiment, smart-money, alerts, strategies.
- **MCP server** wrapping the same tools (get_portfolio_sentiment, get_smart_money, get_alerts, run_strategy) for any MCP agent.
- Per-key auth + rate limits; report generation is never a free-call tool (hits the same per-user quota).

Done when: an external MCP client can authenticate and pull a user's full sentiment + smart-money picture.

Phase 9 — Agent — Daily Report + Alerts [was Phase 7]

Goal: Personalized, well-reasoned daily PDF report led by portfolio impact, plus instant alerts. The materiality alert engine already shipped in Phase 3.5 — this phase adds Claude narrative + delivery.

- **Scheduled report:** reuse the ReportLab report builder; feed per-user sentiment + impact + smart-money context; generate prose with the **Claude API** (Ollama as dev/fallback). Cadence: Plus 1×/day, Pro 2×/day.
- **Lead with the North Star:** open with today's most important event + its % portfolio exposure.
- **Grounding, not model choice:** every claim cites a number (z-score, exposure %, smart-money fact).
- **Delivery:** email the report + real-time alerts (alert materiality + dedupe already built in 3.5); Pro gets Claude narrative within quota.

Done when: a Plus user gets a daily portfolio-grounded PDF (Pro also an intraday one) and a major event pages them within minutes — all inside the Phase 6 quota/cost guardrails.

Sequencing & dependencies

4 → (5, 6) → 7 → 8 → 9. Deploy + domain + HTTPS (4) come first because both OAuth (5) and billing (6) need public callback/webhook URLs. 5 and 6 can run in parallel once 4 lands. Strategies (7), API/MCP (8) and the Agent (9) are feature work on top of a live, paid platform.

Now	Next	Then	Later
Phase 4 Deploy · Domain · HTTPS	Phase 5 · OAuth Phase 6 · Billing	Phase 7 · Strategies	Phase 8 · API/MCP Phase 9 · Agent

Cross-cutting (runs alongside the phases)

- **Email provider:** Resend or AWS SES — powers verification, password reset (Phase 5), alerts + daily reports (Phase 9).
- **Monitoring & backups:** error tracking, uptime checks, automated Postgres backups (stand up in Phase 4, maintain after).
- **Legal:** the 'informational, not investment advice' disclaimer is live; add Terms + Privacy before billing (Phase 6).
- **Open data gap:** live Congress data still runs on the bundled sample until a free source URL is set (CONGRESS_TRADES_URL) or a paid feed is chosen.

SenIQ is informational, not investment advice. Built on the ai-portfolio-copilot codebase. Roadmap doc generated 2026-06-20.
